

ENERGY SAVINGS & INSECT PREVENTION WITH PREVENTOL

TERMITE DAMAGE

Most people don't even know they have a problem until it's too late. But Progressive Foam Siding Insulation is treated with PREVENTOL[®]™ EPS Preservative Insecticide (PREVENTOL[®]™ EPS). So, it does more than just save energy; it protects your home from insect damage.

PREVENTOL[®]™ EPS kills termites and other insects.

- Termites tunnel through foam to access the wood. The foam conceals the insects, leaving them undetected where they then can damage the wooden parts of the structure.
- The tunnels they leave behind also damage the insulating foam. Tunneling reduces the insulating value and their excretions compromise the strength of the foam.
- PREVENTOL[®]™ EPS doesn't just repel termites and insects, it kills them before they can inflict real structural damage.
- The active ingredient in PREVENTOL[®]™ EPS is safe for installers and homeowners. The active ingredient is used in crop protection and your pet's topical flea and tick control treatment.

Protect your home inside and out with Progressive Foam Siding Insulation treated with PREVENTOL[®]™ EPS.
